

Domino Oil & Grease Skimmer

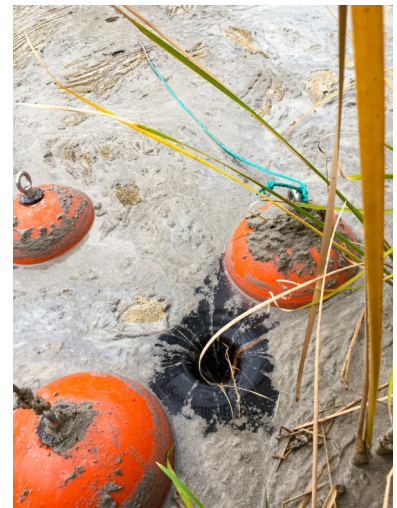

Skimmers are devices that skim the surface of contaminated water catchment areas allowing for the hydrocarbon pollutants to be removed.

The Domino range of Oil Water Separators Systems uses the skimmer to provide for an anchor point for the suction pipe of the delivery pump supplying the VGS.

The skimmers shown below are manufactured from stainless steel and are supplied complete with the floats and suction basket, providing for a stable suction head.

The skimmer would be installed in the primary treatment tank allowing for the contaminated water to be transferred to the Domino System in operation and is supplied as part of the Domino System purchased.

EWA are able to supply, install and commission larger skimmers for use in Settling ponds and or Evaporation ponds
